It has been suggested that soluble interleukin-2 receptor (sIL-2R) is involved in the pathogenesis of Kawasaki disease (KD). On the other hand, tumor necrosis factor-alpha (TNF-alpha) has been demonstrated to be associated with Kawasaki disease. The present study was carried out to determine the plasma levels of sIL-2R and TNF-alpha in KD patients and to investigate whether the concentration of sIL-2R and TNF-alpha correlates with the activity of KD. Plasma levels of sIL-2R and TNF-alpha were determined by ELISA in 24 KD patients, 22 bacterial and 2 viral infection control patients and 16 healthy children. In KD patients, significantly higher concentrations of sIL-2R and TNF-alpha were observed when compared with the control group (P
